

PathoSEEK® Pan Pythium and Pan Fusarium Detection Assays

Method Developer Validation

Introduction

The oligos for the Pan Fusarium assay were designed to amplify 10 different Fusarium species reported to be found on cannabis ([Table5](#); Punja et al 2023)¹:

- *Fusarium avenaceum*
- *Fusarium brachygibbosum*
- *Fusarium equiseti*
- *Fusarium falciforme*
- *Fusarium graminearum*
- *Fusarium lichenicola*
- *Fusarium oxysporum*
- *Fusarium proliferatum*
- *Fusarium solani*
- *Fusarium sporotrichioides*

The oligos for the Pan Pythium assay were designed to amplify 5 different species reported to be found on cannabis ([Table1](#); Lung et al 2021)²:

- *Pythium aphanidermatum*
- *Pythium catenulatum*
- *Pythium dissotocum*
- *Pythium myriotylum*
- *Pythium ultimum*

Method Validation

Our team received multiple root samples from cannabis plants infected with Fusarium and/or Pythium that were submitted by a plant pathologist. DNA was extracted from the samples, using the Medicinal Genomics Quick Lysis Solution and tested using the PathoSEEK® Fusarium Detection Assay and the PathoSEEK Pythium Detection Assay. Table 1 below shows the results from those tests.

Limits of Detection

The Limit of Detection (LOD) is a measure of the qPCR assay's sensitivity. The LOD was tested by doing a 10-fold serial dilution using the Fusarium and Pythium positive controls in a cannabis matrix. The approximate copy number was determined using the provided OD260 and amplicon length. This experiment was performed on both the Biorad CFX96 qPCR Instrument and the Biomolecular Systems Mic qPCR Instrument along with the Myra Liquid Handling System.

These studies, shown below in Tables 2 and 3, indicate that the PathoSEEK Pan Fusarium Detection Assay can reliably detect down to 53 copies, and the PathoSEEK Pan Pythium Detection Assay can reliably detect down to 8 copies. Please note that Cq values greater than 35 are determined inconclusive.
